A highly specific, programmable,
AI-evolved, oncolytic enzyme discovery
platform

Tyler Waite

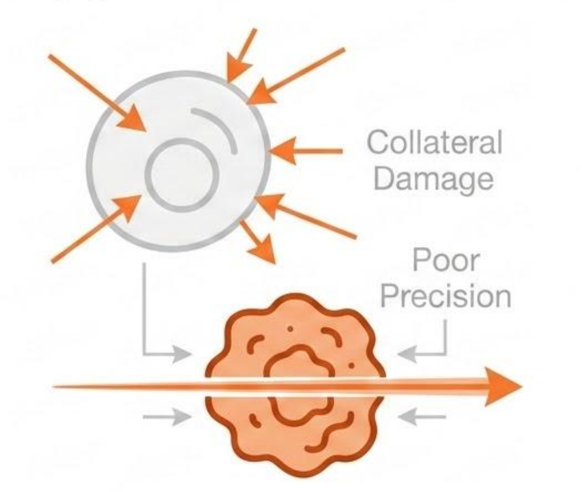
SENARY BIO

THE PROBLEM: STANDARD OF CARE FOR CANCER IS INSUFFICIENT AND IN SOME CASES DETRIMENTAL

- **Chemotherapy is a bad drug:** lacks specificity - kill's dividing cells

- Radiation + Chemo destroys healthy tissue, especially immune cells

- **The paradox:** Chemo leads to high rates of secondary cancers



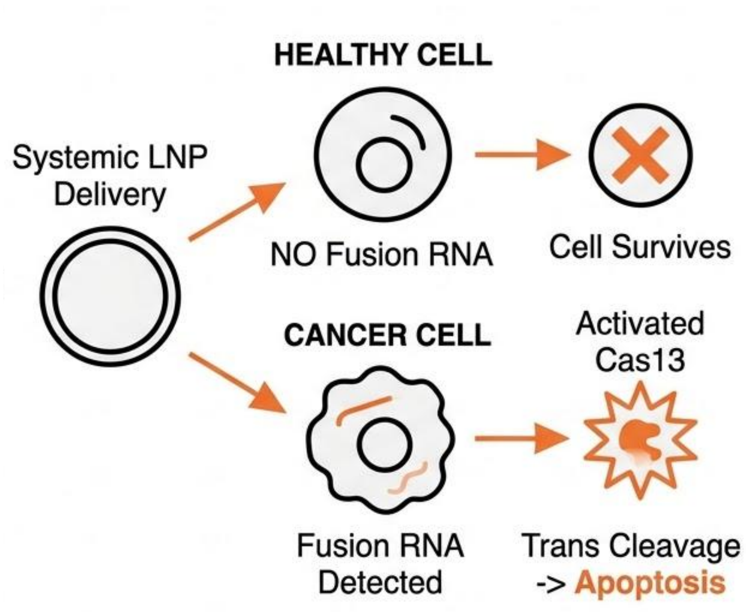
"Chemotherapy is basically poisoning the body and hoping the cancer dies before the patient does…"

THE SOLUTION: A SAFER, SELECTIVE ONCOLYTIC - A TUMOR SUICIDE SWITCH

- **Hypothesis:** Leverage and evolve a high-precision CRISPR enzyme family targeting transcripts only in tumors

- **MOA:** Utilize inherent RNA degradation activity for selected therapeutic effect (cancer cell death)

- **Differentiation:** Contrarian AI-steered evolution towards increased specificity and utilizing a known “bug” in these systems other companies avoid/ try to engineer away.



WHY BUILD THIS: UNMET NEED AND POPULATION DYNAMICS

PROSTATE CANCER: TMPRSS2-ERG | 40-50% of cases has unique fusion gene | 600k patients/year [1]

CHRONIC MYELOID LEUKEMIA: BCR-ABL1 | 95% of cases has unique fusion gene | 34k patients/year [2]

NSCLC: EML4-ALK | 5-10% of cases has unique fusion gene | 125k patients/year [3]

EWINGS SARCOMA: EWSR1-FLI1 | 85% of cases has unique fusion gene | 200-300 patients/year [4]

STANDARD OF CARE FLAWS: low efficacy, treatment resistance, off-target toxicity, secondary malignancies, and severe permanent side effect (cardiac, cognitive, etc)
5 year mortality rates vary from **5-70%** based on disease [1,2,3,4]

1. Perner et al., 2007... 2. Lei et al., 2022... 3. Akhilesh et al., 2023... 4. Gong et al., 2023... 4. Menen et al., 2023...

DIFFERENTIATION: WHY SENARY AND WHAT'S OUR EDGE

Contrarian hypothesis: Industry and academia believe the mechanism we want to harness is a bug, we believe it is a feature

Unique AI discovery: We use cutting-edge open weight diffusion AI, trapped in continuous RL environments to retrain our models and evolve/engineer novel enzymes

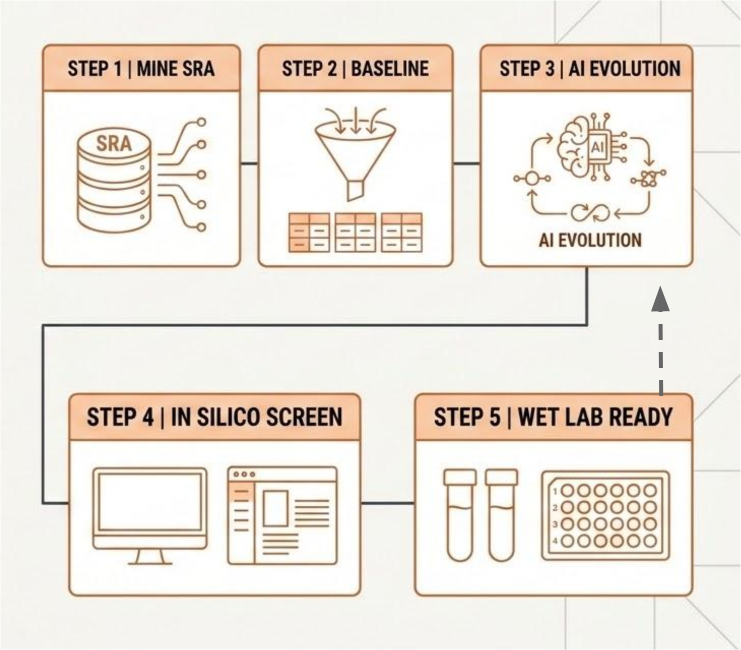
IP: First to file, we have filed for 8 enzyme structures. We are ready to evolve and patent more. But we need capital to test them...

SYSTEM DESIGN : THE CUTTING EDGE EVOLUTION ENGINE

Foundational AI/RL Platform: Our pipeline is a foundational tool, retrainable, and non-single asset

Abstracted Malleable Architect: Built for continuous, novel discovery and evolution across modalities. Molecule agnostic

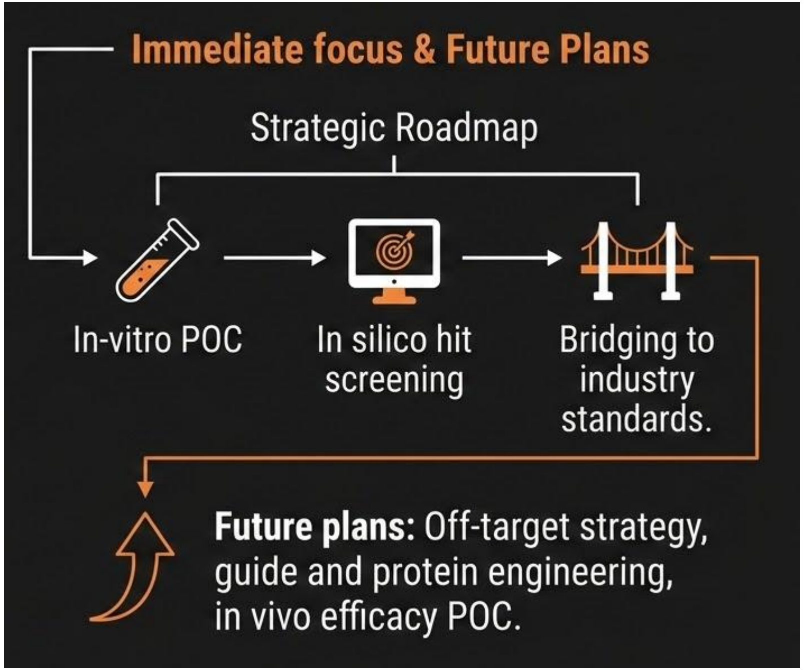
Novel System Engineering: Simulate and engineer new enzyme systems beyond standard CRISPR, guided by defined metrics of function



WHERE WE ARE NOW AND WHERE WE WANT GO

CURRENT PROGRESS AND ASSETS

- Active wet lab data generation at Frontier Tower biohacker space
- Novel CRISPR-family-like enzyme sequences ready for wet lab screening and patent filed
- Computational models running and evolving over time. Constant improvement and iterations. Room for growth.



THE TEAM

Tyler Waite

MS in AI Engineering

Early hire at two Biotech startups
(From series A-IPO)

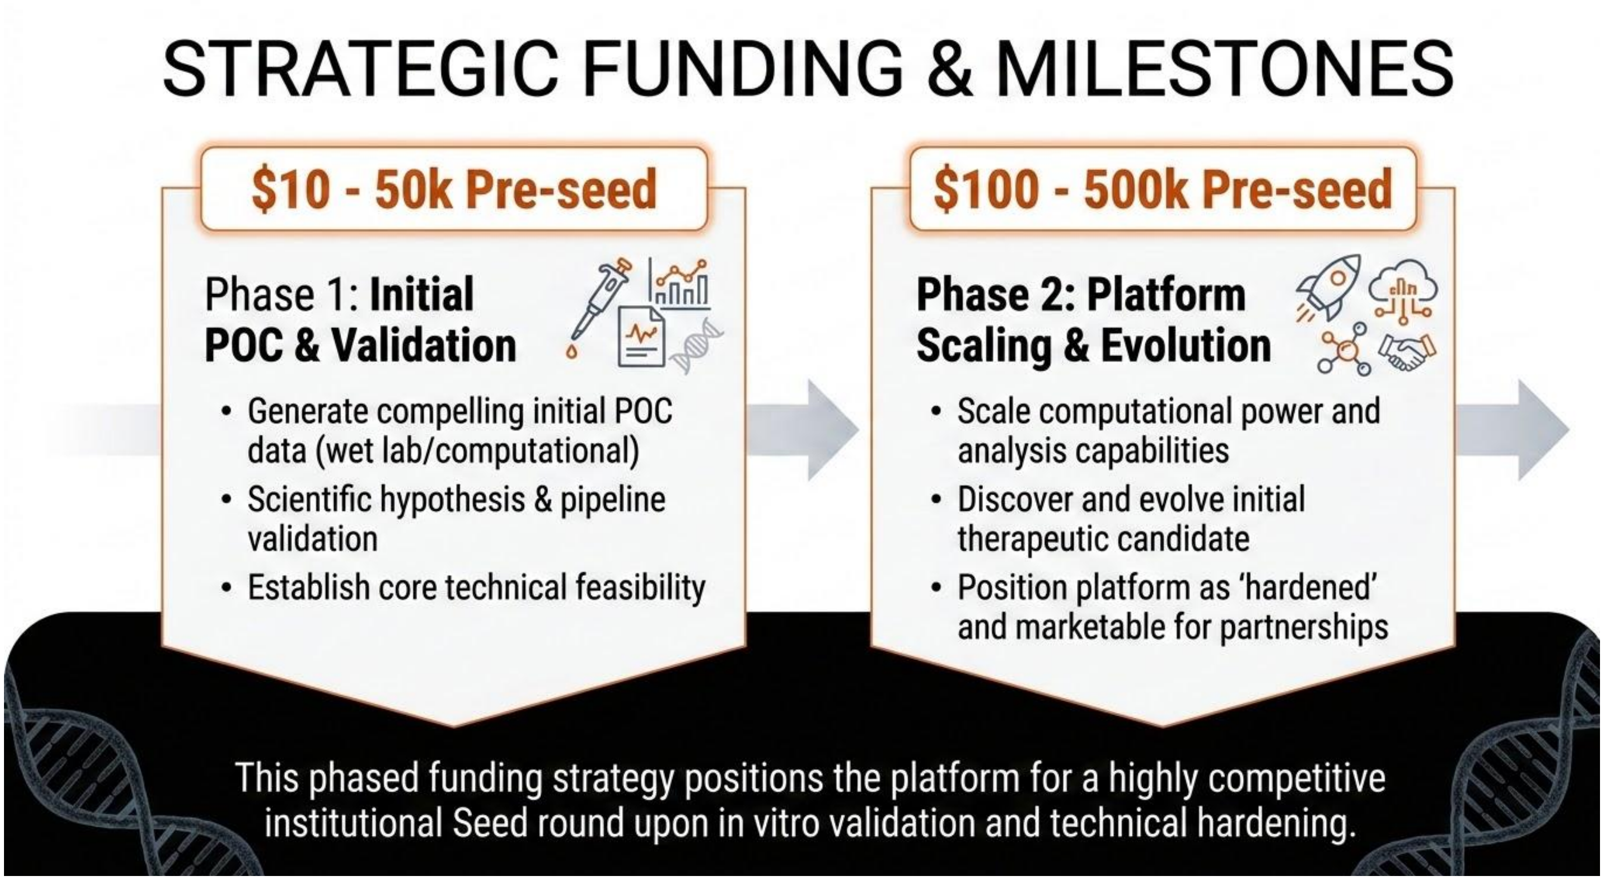
Deep gene-editing & comp
bio experience

Ex-Genentech / Current Meta

Actively Searching For Cofounder

Ideal Experience:

Early stage biotech development (or)
AI research and design (or)
Gene editing screening optimization (or)
Fundraising / Go to Market Biotech



STRATEGIC FUNDING & MILESTONES
$10 - 50k Pre-seed
Phase 1: Initial POC & Validation
• Generate compelling initial POC data (wet lab/computational)
• Scientific hypothesis & pipeline validation
• Establish core technical feasibility
$100 - 500k Pre-seed
Phase 2: Platform Scaling & Evolution
• Scale computational power and analysis capabilities
• Discover and evolve initial therapeutic candidate
• Position platform as 'hardened' and marketable for partnerships
This phased funding strategy positions the platform for a highly competitive institutional Seed round upon in vitro validation and technical hardening.
